*Tiling in Bipartite Graphs*

Bipartite graph tiling was studied by Zhao who gave the minimum degree conditions for a balanced bipartite graph on  $2ms$  vertices to contain  $m$  vertex disjoint copies of  $K_{s,s}$ . The case  $s < t$  was recently solved by Hladky, Schacht and Czygrinow, DeBiasio. In this talk we will discuss the minimum degree conditions for the existence of a bipartite tiling and a sum of degree condition for the same problem. This is a joint work with DeBiasio.
